

Intelligent Candidate Discovery & Ranking Engine

Build a system that takes a Job Description (JD), parses a large candidate dataset, and outputs a highly accurate, ranked list of the best candidates. Most importantly, the system must make those rankings explainable.

Deliverables

The Code

Clean, readable, and well-documented code detailing:

- Data parsing
- Feature extraction
- Model execution
- Candidate ranking logic

The System Architecture Note

A brief breakdown or diagram explaining the complete system pipeline.

A Brief Video Demo

A quick screencast showing the engine in action:

- Taking a job requirement as input
- Parsing the dataset
- Generating explainable, ranked candidate results

Problem Statement

Right now, companies miss out on thousands of brilliant candidates because old-school recruitment tools rely on basic keyword matching.

Your task is to build an **Intelligent Candidate Discovery & Ranking Engine**.

You are provided with:

- **A Real-World Job Description (JD):** Your anchor point for identifying target skills and requirements.
- **A Massive Candidate Dataset:** Rich candidate profiles containing career metadata, historical resumes, skill distributions, and platform activity signals.
